**OFFSET WELL DATA****GEOSCIENTIFIC INFORMATION OF UPPER ASSAM BASIN:**

The Upper Assam Basin is truly a Tertiary sub-basin of the Assam-Arakan geological province located in the north-eastern part of Indian subcontinent. The Upper Assam basin had received clastic sediments in varied shallow marine to paralic and non-marine (deltaic, fluvial) environmental conditions in different geological times during Tertiary period. In the present day configuration of the basin, the basement dips both towards southeast and northwest on the southern and northern flanks of the basement ridge, respectively. The sedimentary thickness, which is less than 4 km along the axis of the basement ridge, increases to more than 7 km towards Naga-Patkai range and the Eastern Himalayan foothills region.

Commercial oil/gas accumulations discovered so far occurs mainly in the fault closures within a depth range of about 2200-3600 metres in Miocene and Oligocene reservoirs and 3400-5400 metres in the Paleocene/ Lower Eocene reservoirs. Presently, substantial amount of the oil is produced by the Company from these Paleocene/ Lower Eocene thin clastic reservoirs. The Paleocene Lower Eocene formations are over pressured while Oligocene and younger formation are nearly hydrostatic.

## **SPECIAL NOTE ON BAREKURI - BAGHJAN FIELD:**

### **BAREKURI FIELD**

The hydrocarbon prospects of the Barekuri field are confined to Paleocene/Lower Eocene and average depth of the reservoir is around 3740 m below MSL. So far, OIL has drilled nine wells in this structure of which 8 are oil producers and the current rate of production is approximately 1000 m<sup>3</sup>/day with very negligible water cut. Some more wells are planned to be drilled to develop/delineate the pay sands, few of them are horizontal. The initial reservoir pressure is 428.5 kg/cm<sup>2</sup> and the current reservoir pressure is around 428.0 kg/cm<sup>2</sup>.

### **BAGHJAN FIELD**

The main multi-stacked hydrocarbon bearing horizons are confined to the Palaeocene / Lower Eocene sandstone reservoirs. So far, drilling has been completed in 12 wells in the Baghjan structure. The reservoir pressure was found to be around 422.6 Ksc which is 50 Ksc above hydrostatic. The depth to Basement in the Baghjan area is around 3910 m below MSL and average depth of the reservoir is around 3700 - 3800 m below MSL. The area has been covered by 3D seismic survey. Some more wells are planned to be drilled to delineate extremes of the pay sands which include few horizontal and J-bend/ directional wells.
