A. General:

Corrosion Resistant Material Selection Software is required to aid in comprehensive selection of corrosion resistant alloys(CRA) in oil and gas production, transportation, downhole, wellhead and flowline applications. The software program should allow users to determine causes of various degradation mechanisms such as localized corrosion, SCC, etc for different materials in various O&G environments. This software program should be able to consider environments containing CO₂, H₂S and various other species and should be able to account for operating factors like pressure, temperature, flowrates, gas and formation water analysis etc. The software system should be user friendly and compatible with Microsoft Windows XP or higher versions of OS and MS office 2007 or higher versions.

B. Capabilities:

The software should, at minimum, consider the following factors while evaluating materials:

- i. Effect of presence of CO₂ and H₂S;
- ii. Effect of pH on corrosion rates;
- iii. Effect of various ionic species such as chlorides, dissolved oxygen, acetates, carbonates and bicarbonates on ionic strength;
- iv. Scaling effects for iron carbonate and iron sulfide;
- v. Effect of temperature and flow rate on scale formation and stability;
- vi. Effect of flow rates (wall shear stress) on corrosion rates in production tubular and transmission lines;

C. Supported Application:

The software should support the following applications for selection of alloy metallurgy:

- Tubing
- Liners
- Well head
- Sub Surface Equipments
- Flow lines

D. Features:

The software should have the following minimum features:

1. Should be able to select optimum CRA materials for critical, high corrosivity applications (including CO₂, high H₂S, high chloride oil and gas production and transmission lines).
2. Should validate the use of CRA for existing applications through material and property analysis.
3. Should be able to quantify and compare costs of CRA choices to help determine the best material option for new equipment.
4. Should be able to perform Corrosion-rate prediction for sweet and sour service conditions based on the fundamental chemistry of the solubility of the corrosion products
5. Should be able to perform quantitative evaluation of corrosion-resistant-alloy suitability for a matrix of conditions that covers temperature, partial pressure of carbon dioxide and hydrogen sulphide, chloride content and pH.
6. Should be able to perform metal and inhibitor evaluation alongside CRA assessment to determine the appropriate material choice.
7. Should be able to reveal potential for CRA equipment failure due to corrosion and cracking mechanisms.
8. Should be able to find materials for non-production applications (acidizing, injected waters, completion fluids)
9. Should perform single point and survey calculations of corrosion rates in the piping system.
10. Should have report creation facilities in PDF or Excel formats and should be able to load/save from/to excel file or any other MS office format.
11. Should have ability to create user specific alloy groups.
