Part – 3

SECTION – II

SCOPE OF WORK/TERMS OF REFERENCE/TECHNICAL SPECIFICATION

1.0 Introduction:

1.1 This Section establishes the scope and schedule for the work to be performed by the successful Bidder and describes references to the specifications, instructions, standards and other documents including specifications for any materials, tools or equipment which the Bidder shall satisfy or adhere to in the performance of the work.

2.0 Scope of Work:

2.1 This tender is sought pursuant to the work programme for Siyasar, Rajasthan, India awarded by the Government of India. Oil India Limited (Company) as the operator intends to acquire 2D Seismic Data, using Vibroseis as source and process the same with state-of-the-art equipment, hardware and software. The work programme is for 1500 GLKM of 60 full fold 2D Seismic Vibroseis Data Acquisition & Processing (AP).

3.0 Location, Boundary Corner Points & Logistics of the Block:

3.1 The co-ordinates of the block Siyasar, Rajasthan, India area are given below:

Block Area: 3012 Sq. Kms

Pt.	Co-ordinates					
	Longitude			Latitude		
	Deg.	M	S.	D.	M.	Sec.
1	72	40	0	28	10	0
2	72	40	0	28	50	0
3	73	00	0	28	50	0
4	73	00	0	29	00	0
5	73	10	0	29	00	0
6	73	10	0	28	40	0
7	73	00	0	28	40	0
8	73	00	0	28	10	0

3.2 The proposed Block is attached as Figure-1. The tentative planned 2D seismic profiles are shown in the map (copy enclosed).

3.3 Geological Setup

The Bikaner-Nagaur Basin located in the north western part of the peninsular Indian Shield. Structurally, the Bikaner-Nagaur Basin is bounded in the east by Delhi-Aravalli folding, in the SSW by the Pokra-Nachna High separating it from the Jaisalmer Basin, and in the northeast by the Delhi-Sargoda Ridge. The basin slopes to the north and northwest, and merges with the Indus Shelf. The Bikaner-Nagaur Basin has a stratigraphic succession of sediments of Cambrian, Permo-Triassic, Mesozoic, Tertiary, and Quaternary age. The Lower Cambrian comprises sediments of the Marwar Supergroup, divided into the Jodhpur Formation (comprising predominantly sandstone interbedded with bands of shale and

limestone), the Bilara-Hanseran Evaporite Group (comprising limestone dolomite-evaporite with thin bands of clay-shale), and the Nagaur Formation (comprising argillaceous and arenaceous facies).

The structure of the block is characterized by faults with apparently normal displacements, with some evidence for strike-slip movement. Faulting appears to strike approximately NE-SW with some faults dipping to the NW and others to the SE. The Jodhpur Formation is main reservoir unit. The facies analysis indicates that the sediments have been deposited in fluvial to marginal marine environments. Trapping potential is provided by broad anticlines and by some 3-way dip closures against faults. The Hanseran Evaporite Group, deposited in a restricted marine, possibly supratidal environment, acts as an effective seal.

The Nagaur Formation comprises sandstone, anhydrites and mudstones deposited in open marine to partially restricted upper shoreface settings. The best reservoir potential for the Nagaur Formation is associated with sand intervals forming the upper part of coarsening-upward sequences of transgressive-regressive cycles. The lower part of the Upper Carbonate Formation comprises anhydrites and some tight dolomites which could seal Nagaur reservoirs. The distribution of these potential seals is unknown and so is one of the key risks for associated prospects.

The Upper Carbonate comprises open marine to partially restricted lagoon/inner shelf carbonates sediments. Within the Upper Carbonate Formation the best reservoir potential was found in the lower part of the interval.

3.4 **Geological objectives of the survey:**

It is proposed to acquire 2D seismic data covering area using state-of-art technologies with the following objectives:

- a) Delineation of hydrocarbon zones.
- b) Determine OIL bearing zones

- d) Identify prospects and delineation of faults in deeper formation.

Survey design study has been carried out for a proposed 2D-survey in OALP block surface area in Rajasthan. Inputs used in the study are taken from available geo-scientific information derived from the seismic data, drilled wells and geologic model.

B.1.0 SEISMIC DATA PROCESSING:

B1.1 Scope of Work:

The Contractor shall carry out processing of 1500 GLKM of 60 full fold Vibroseis 2D Seismic data acquired under this Contract. The Contractor must use state-of-the-art computer system with internationally used software which will be capable of carrying out 2D stack and time migration.

B1.2 Company reserves the option to increase/decrease the volume for 2D Seismic Data Processing up to $\pm 20\%$ of the tender quantity of 1500 GLKM. In case of any increase/decrease in quantum, it will be obligatory on the part of the Contractor to carry out the job at the same rate, terms & conditions of the contract.

B1.3 The objective of seismic data processing is to provide adequate outputs for structural and stratigraphic interpretation, reservoir delineation/characterization etc.

B1.4 The 2D seismic data shall be processed to bring out the structure, faults, stratigraphy, lithology and internal variations at both deeper and shallower levels. The area is covered by sand dunes of variable heights (at times >30 meters), so is the variation in weathering layer velocity and thicknesses and sub-weathering velocity as well, so application of proper statics/residual statics is a must for proper delineation of prospects. In addition, there are expected to be several near-Surface velocity anomalies (due to lithological variations and Limestone quality).

So, proper velocity analysis to get a suitable velocity for stack and migration is the key to improve S/N Ratio. Resolution of variable thickness limestone/sandstone pay zones is a key problem in terms of their identification and definition. The log data of key wells if available would be provided for synthetic seismogram generation (minimum 3 wells). The following tentative processing sequence will be determined after completion of test processing in consultation with Company representatives. It is also envisaged that the data will be processed for preserved/true amplitudes.

- I Reformat to internal format
- II Geometry preparation and QC.
- III Trace editing
- IV Navigation QC
- V Geometry Preparation and Seismic/Navigation data Merge
- VI Computation of Refraction statics by various methods. Compare refraction statics solutions with Elevation & Field statics and application of the one producing best results.
- VII Amplitude Recovery analysis and Application.
- VIII Near-surface heterogeneity corrections through full determination including source, receiver and residual structure terms.
- IX Noise filtering on shot records,
- X Low cut filtering: 5 Hz., 18 dB/Oct,
- XI Trace editing,
- XII Filtering for data balancing of the acquisition instrument spectrum,
- XIII Discard noise traces
- XIV Reverse polarity correction, if any
- XV Minimum phase conversion
- XVI CMP binning
- XVII Despiking
