WORKS CONTRACT**

PARTICULAR SPECIFICATIONS AND INSTRUCTIONS:

DESCRIPTION OF WORK/SERVICES: Construction of Concrete Mattress at Shift Bus Terminus (SBT), Kamalabari, Duliajan including supply of all materials except cement.

1.0 SCOPE OF WORK**1.00 GENERAL:**

All materials used in the work shall conform to the latest revision of the relevant Indian Standard Specifications to the extent practicable. Where no such specifications exist they shall be of the best quality available in the market. Wherever ISI certified materials and products are available these alone shall be used. All materials shall be stored at site in accordance with IS-4082-1996. Unless specially provided for in the contract the tendered rates shall include the cost of carriage, transport, loading, unloading and stacking as directed for all materials required on the work. Where a tender provides a rate for transport of materials, it includes for all loading, unloading and stacking on the site in such position and manner as directed. Any materials found not conforming to specification must be removed from site within 48 hours.

2.00 STORAGE:

Materials shall be transported, handled and stored at site carefully to the approval of Engineer so as to prevent any damage of any kind to be kept at his own risk and cost. Cement shall be stored in a weather proof shed, the floor of which shall be raised 300 mm clear from the ground and 600 mm away from the wall all round in order to protect from rain and moisture. Empty cement bag shall be returned to the Company in good condition.

3.00 GRANULAR SUB-BASE:

All dirt, dust, rubbish, tree leaves etc. must be removed from the base and shall be graded to the correct camber by using proper templates. Granular sub-base work shall consist of laying and compacting well-graded Granular materials over the base. The material shall be laid in one or more layers as necessary, as directed by the Engineer in charge. The granular sub-base shall then be heavily rolled with an 8 to 10 ton roller to the correct camber.

4.00 CEMENT CONCRETE/ REINFORCED CEMENT CONCRETE WORK:

All C.C. work in 1:3:6 proportions unless otherwise specified shall be done with 18 mm graded down broken stone. Broken stone shall be properly screened before use. All reinforced cement concrete work to be done in prop. 1:1.5:3 unless otherwise specified -- 18mm down to 12mm graded down broken stone as per related drawings and instructions of site Engineer to be followed in case of any discrepancies. Proper vibration to be done as per IS recommendation. Floor panelling to be done in the line of expansion joint as directed by Engineer-In-charge.

Fine Aggregate - Fine aggregate shall be hard, durable, clean and free from adherent coating and organic matter. It shall not contain harmful impurities such as pyrites, coal, lignite, mica, shale or similar laminated material, clay, alkali, soft fragments, sea shells and organic impurities in such quality as to affect the strength or durability of the concrete. Fine aggregate to be used for reinforced concrete shall not contain any material liable to attack the steel reinforcement. Fine aggregate which is chemically reactive with alkalis of cement is harmful as cracking of concrete may take place.

Coarse Aggregate - Coarse aggregate shall be obtained from natural sources such as stone, gravel, etc. crushed or uncrushed or a continuation thereof from approved quarries. This shall consist of coarse material most of which is retained on 4.75mm sieve. Aggregate shall be hard, strong, dense, durable, clean and free from veins and adherent coatings. It shall be free from soft, feeble, thin, elongated or laminated pieces and shall be cubical/rounded in shape. It shall be clear and free from dirt and any other deleterious matter.

Reinforcement bars - The following types of steel for reinforcement shall be used in reinforced concrete construction and these shall conform to Indian Standards or as revised from time to time mentioned against each

1) Mild steel and medium tensile steel bars and hard drawn steel wire – IS: 432.

2) HYSD bars – IS: 1786.

Bending & Placing steel reinforcement in position-Bending shall be carried out as per relevant IS specification and direction of the Engineer-in-charge. All reinforcement bars shall be accurately placed in position with spacing and cover as shown in the drawing or as specified and firmly held so during the placing and vibrating and setting of concrete. Bars shall be thoroughly cleared of rust, seals, grease, oil and any other foreign matter before placing them in position. The overlap jointing shall be staggered. The bars shall be fixed with 22G binding wire. Precast cover blocks 1:2 (1 cement: 2sand) cement mortar 40 mm square and necessary thickness shall be used to keep the reinforcement bars in proper position. For this block, no extra payment to be made. Wire required for binding shall not be measured separately. Tack welding shall also be permitted in lieu of building with steel wire.

Proportioning of mix - Proportioning shall be done by volume. Boxes of suitable size shall be used for measuring sand and aggregates. The size of the boxes (internal) shall be 35 x 25cm and 40cm deep. The unit of measurement for cement shall be a bag of cement weighting 50 Kg and this shall be taken as 0.035 cubic meter. While measuring the aggregate and sand the boxes shall be filled without shaking, ramming or hammering. The proportioning of sand shall be on the basis of its dry volume and in case of damp sand; allowances for bulkage shall be made.

Mixing - Mixing of reinforced cement concrete shall, as a rule be done in a mechanical mixer. However, the Engineer-in-charge may permit hand mixing in specific cases where in his opinion it is not practicable to resort to mechanical mixing, either on account of the quality of cement concrete required is small or for any other reason. In such cases, it should be ensured that the inferior quality of concrete produced by hand mixing will not adversely affect the structure.

Consistency - The quantity of water to be used for each batch containing 50 Kg of cement, to give the required consistency shall not be more than 34 liters for 1:3:6, mix 32 liters for 1:2:4 mix, 30 liters for 1:1.5:3 mix and 27 liters for 1:1:2 mix. In case of vibrated concrete, the above quantity shall be suitably reduced. The quantity of water shall be regulated by carrying out regular Slump Test.

Placing of concrete - Before placing the concrete the sub-base/form work shall be cleared of all injurious or foreign matter, watered and well consolidated. The sub base shall be properly compacted by Road Roller. Also a separation membrane shall be used in between concrete and sub base. The separation membrane shall be impermeable plastic sheeting of suitable thickness laid flat without creases. Formwork shall be clean and free from all foreign material. It is necessary that the time between mixing and placing of concrete does not exceed the initial setting process. Mixed concrete that has been left standing shall not be used after the initial set has commenced the addition of water (or cement) to make such a mixture more workable shall not be allowed. In foundation trenches or such other situations, the entire concrete used in the work shall

be laid gently (not thrown) in layers not exceeding 15cm. The concrete so deposited shall be thoroughly vibrated by means of mechanical vibrators till dense concrete is obtained.

Curing - Concrete shall be carefully protected during first stage of hardening from harmful effects or excessive heat, drying winds, rain or running water and shock. After the concrete has begun to harden i.e. about 1 to 2 hours after its laying it shall be protected from quick drying with moist gunny bags or any other material approved by the Engineer-in-charge. After 24 hours of laying of concrete the surface shall be cured by flooding water up to 25mm depth or by covering with wet adsorbent materials. The curing shall be done for a minimum period of 7 days from the date of pouring of concrete, unless otherwise specified.

5.00 FORM WORK:

The formwork shall be rigid and so corrected as to retain the shape and dimensions of the member being cast. Form work for concrete shall be seasoned timber or other approved materials as per directions of the Engineer. It shall be sufficiently tightened to prevent loss of cement slurry and all holes and joints shall be caulked with putty. It shall have sufficient strength and rigidity to withstand the load of concrete, and vibrations, movement of men, materials and plants and any other incidental loads without excessive deflection beyond permissible limits. The formwork shall be so constructed as to be removable in sections by inscribing or otherwise loosening – them without hammering or levering with force. Only wedges, clamps bolts or screws etc. shall be used in preference to nails or spikes. All side pieces shall be easily removable without disturbing the bottom pieces. Whenever, use of nails and spikes become unavoidable, these shall be left projecting so that they can easily be withdrawn.

Surface treatment for shuttering - Forms shall be cleaned of all dust, wood shavings, dirt and other matter by washing with water. This process is facilitated by providing draining holes in the shuttering. The surface shall then be coated with soap solution applied before concreting is done. Soap solution for the purpose shall be prepared by dissolving yellow soap in water to get consistency of paint. Alternatively a coat of raw linseed oil/refined pale paraffin mineral oil or form oil of approved manufacture may be applied. In case steel shuttering is used, soap solution or row linseed oil shall be applied after thoroughly cleaning the surface. Care shall be taken that such approved composition is kept out of contact with the reinforcement.

In normal circumstances and where ordinary Portland cement is used form may generally be removed after the expiry of the following periods.

- a) Walls, columns and vertical face of all structural members as may be decided by the Site Engineer: 24 to 48 hours.
- b) Slabs side (props left under): 3 days
- c) Beam soffits (props. left under): 14 days
- d) Removal of props under slabs
 - i) Spanning up to 4.5 m: 14 days
 - ii) Spanning over 4.5 m: 21 days
- e) Removal of props under beams:
 - i) Spanning up to 6 m: 21 days
 - ii) Spanning above 6 m: 28 days

In no circumstances shall forms be struck until the concrete reaches a strength of at least twice the stress to which concrete may be subjected at the time of removal of form work. All form works shall be removed without such shock or vibration as would damage the concrete. Form work for long span deep beams to be supported by MS props or Bhaluka Bamboo props as required based on the design for the formwork to take care the massive load of the green concrete.

6.0 JOINTS:

The Location and type of joints shall be as shown in the drawing and as directed by Engineer-in-Charge. Concrete along the sides of joints and around the tie /dowel bars shall be properly compacted using a mechanical vibrator to ensure concrete free from honeycombing. All joints shall be properly installed in accordance with the location and details given in the plan.

(i) Expansion joints: These shall extend to the entire width of the mat. They shall be of dimension and spacing as shown in the drawing. A premoulded expansion joint filler board shall be used to fill the gap between adjacent slabs at expansion joints. The height of the filler board is such that its top is 25mm below the top concrete surface. The dowel bars shall be held accurately in position during placement, compaction, finishing of concrete by dowel chair assembly.

Sealing grooves can be formed by placing wooden strips of suitable section above filler board.

(ii) Contraction joints: These shall be placed as shown in the drawing. They shall be constructed in the slab by forming a slot not less than 3mm wide and having depth $1/3$ to $1/4$ th of the mat. The slot may be formed by a method approved by Engineer-in-Charge, such as by pushing into the concrete a flat bar, a plastic strip or web of a T bar and removing the bar subsequently and keeping the slot open.

(iii) Longitudinal joints: Longitudinal joints may be of plain butt type and can be formed by placing the concrete against the face of the slab concreted earlier. The face of the slab concreted earlier shall be painted with bitumen before placing fresh concrete.

(iv) Dowel bars: Dowel bars shall be mild steel round bars conforming to IS 432 and in accordance with as detailed/dimensioned in drawing and as directed by Engineer-in-Charge. They shall be free from oil, dirt, loose rust or scale. They shall be straight, free of irregularities. The dowel bars shall be supported on cradles/dowel chairs. Dowel bars shall be covered with a thin plastic sheet for at least 60 percent of the length from one end for dowel bars in contraction joints or half the length plus 50mm for expansion joints. The sheet shall be tough, durable and average thickness not greater than 0.5mm and shall have close end. For expansion joints a closely fitting cap of 100mm length with close end consisting of GI pipe of 3mm thickness shall be placed over the sheathed end of each dowel bar. An expansion space at least equal in length to the thickness of joint filler board shall be formed between the end of the cap and end of the dowel bar using compressible sponge. To block the entry of cement slurry between dowel and cap, it may be tapped around.

(v) Tie bar: Tie bar in longitudinal joints shall be plain mild steel bar conforming to IS 432. The bars shall be free from oil, rust or scale. Tie bar projecting across the longitudinal joints shall be protected from corrosion for 75mm on each side of the joint by a protective coating of bituminous paint.

(vi) Sealing of Joint Grooves: All transverse joints in surface slab shall be sealed using sealants. Joints shall not be sealed before 14 days after construction. All grooves shall be cleaned of any dirt or loose material before sealing.

7.00 MANDATORY TESTS:

The various mandatory tests shall be carried out by the contractor and no separate payment shall be made unless otherwise specified in the schedule of rates. Following tests /test certificate to be produced by the contractor at his own cost.

i) Water for construction and curing to be tested before use ('PH' value should not be less than 6.)

ii) Cube test for RCC to be done as per relevant IS code of practice and as directed by Engineer-in-Charge.

iii) Test certificate for quarry materials, M.S. rod, Tor steel should be produced.
