In case of cohesion less soil, the advancement of the casing pipe shall be such that it does not disturb the soil to be tested or sampled. The casing shall be advanced by slowly turning the casing pipe and not by driving.

d. In-situ tests and collection of undisturbed samples (UDS) shall be carried out at regular intervals and at change of strata or as decided by the engineer-in-charge. Representative disturbed and undisturbed samples shall be preserved for

conducting various tests in the laboratory. Water table in the borehole shall be carefully recorded and reported.

e. The bore hole shall be cleaned using suitable tools up to the depth of testing or sampling ensuring that there is minimum disturbance of soil at the bottom of the borehole. The process of jetting through an open tube sampler shall not be permitted. In cohesive soils, the borehole may be cleaned using a bailer with a flap valve.

f. On completion of the borehole, the portion bored in soil shall be backfilled with sand unless otherwise specified and as directed by the engineer-in-charge.

4.1.2 Auger Boring

Auger boring can be adopted in soft to stiff cohesive soils above water table. Augers shall be of helical or post hole type which may be manually or power operated. While boring care shall be taken to minimize the disturbance to the deposits below the bottom of the borehole. The cuttings brought up by the auger shall be carefully examined in the field and the description of all the strata shall be duly recorded in the field borelog as per IS: 1498. No water shall be used while auger boring.

4.1.3 Shell and Auger Boring

Shell and Auger boring can be used in all types of soil free from boulders. For cohesion less soil below ground water table, the water level in the bore hole shall always be maintained at or above the ground water level. The use of chisel bit shall be permitted in hard strata with SPT 'N' value greater than 100. Chisel bits may also be used to extend the borehole through local obstruction such as old construction, boulders, rocky formations etc.

4.1.4 Standard Penetration Test (SPT)

This test shall be conducted in all types of soil deposits met within the bore hole to find the variation in the soil stratification by correlating with the number of blows required for unit penetration of a standard penetrometer. This test shall be conducted at every 1.5 m interval alternate to collection of UDS upto 10m depth below ground level and at every 3.0 m interval alternate to collection of UDS beyond 10m depth, at every change of strata, at depths wherever undisturbed soil samples could not be collected and as per the directions of the engineer-in-charge. The starting depth of performing SPT shall be 1m below ground level unless otherwise specified. The depth interval between the top level of standard penetration test and to that of (next) undisturbed sampling shall not be less than 0.5m. The specification for equipment and other accessories, procedure for conducting the test, presentation of test results and collection of disturbed soil samples etc shall conform to IS: 2131.

This test shall be carried out by driving a standard split spoon sampler in the borehole by means of a 63.5 kg hammer having a free fall of 0.75m. The sampler shall be driven using the hammer for 450 mm penetration. While driving, the number of blows for every 150 mm penetration and the penetration for every 50 blows shall be recorded. The number of blows for the last 300 mm drive shall be reported as 'N' value. This test shall be discontinued when the blow count is equal to 100 and the penetration shall be recorded. Refusal shall be considered to be met with when the

blow count is equal to 100. At the location where the test is discontinued, the penetration and the corresponding number of blows shall be reported. Sufficient quantity of disturbed soil samples shall be collected from the split spoon sampler for identification and laboratory testing. The samples shall be visually classified & recorded at the site and shall be properly preserved and labelled for future identification & testing.

4.2 Sampling

4.1.1 General

a. Sufficient number of soil samples shall be collected for reliable estimation of soil properties. The samples collected shall be either disturbed or undisturbed. Disturbed soil samples shall be collected for field identification and conducting laboratory tests such as sieve analysis, index properties, specific gravity, chemical analysis etc. Undisturbed samples shall be collected to estimate physical, strength and settlement properties of the soil.

b. All the accessories required for sampling and the method of sampling shall conform to IS: 2132. All disturbed and undisturbed samples collected in the field shall be classified at site as per IS: 1498.

c. All the samples shall be identified with date, bore hole number, depth of sampling etc. It is also essential to mark an arrow pointing towards the top surface of the undisturbed sample as the soil was in-situ. Care shall be taken to keep the undisturbed soil samples and box samples vertically with the arrow directing upwards. The tube samples shall be properly trimmed at both ends and suitably sealed with molten paraffin wax at both ends immediately after extracting the samples from the bore hole/trial pit and suitably capped on both sides.

d. When the contractor fails to collect undisturbed soil sample at a specified depth, the borehole shall be advanced by 0.50m and shall be performed with a standard penetration test. The reason for not obtaining the undisturbed soil sample shall be indicated in the borelog.

e. Precaution shall be taken to ensure that there shall not be any change in moisture content and disturbance of the soil samples and they shall be placed in a temporary store at the end of the day's work. All the samples shall be kept over a bed of sand, jute bags, saw dust etc and covered over the top with similar material. The bed and top cover shall be kept moist till they are properly packed in wooden boxes. The contractor shall be responsible for packing and transporting of all the samples from site to the laboratory within seven days after sampling with proper protection against loss and damage.

4.2.2 Disturbed Samples

a. Disturbed soil samples shall be collected from cuttings and from SPT sampler in boreholes at regular intervals to provide complete description of soil profile and its variation. The samples shall be immediately stored in airtight jars or polythene bags and labelled with borehole/trial pit number and depth.

4.2.3 Undisturbed Samples

Undisturbed samples of 100mm diameter shall be collected in soft to stiff clayey strata from all boreholes at intervals of 3.0m in depth or at every change of stratum whichever occurs earlier. First, UDS to be collected from 1.5m depth below existing ground level in clayey soil. In adjacent boreholes depth of sample collections shall be staggered to cater for full layer. The area ratio of the sampling tubes shall not exceed 20%. In soft deposits, piston sampler shall be used to collect UDS. Quoted rates shall include transport of samples to the laboratory. Care shall be taken to minimize sample disturbance while collection of samples. Samples shall be collected preferably by pushing the sampler. Driving by hammer above ground level (like SPT) is not acceptable. However, for stiff/hard soil a sliding hammer can be used for driving the sampler at sampler head. In one borehole maximum four UDS samples should be collected.

4.3 Ground Water

4.3.1 One of the following methods shall be adopted for determining the ground water table in bore holes as per IS: 6935 and as per the instructions of the engineer-in-charge.

a. In permeable soils, the water level in borehole shall be allowed to stabilize after lowering it adequately by bailing. When water level inside the borehole is found to be stable, the depth of water level below ground level shall be measured. Stability of sides and bottom of the borehole shall be ensured at all times.

b. For both permeable and impermeable soils, the following method shall be suitable. The borehole shall be filled with water and then bailed out to various depths. Observation on the rise or fall of water level shall be made at each depth. The level at which neither a fall nor a rise is observed shall be considered as the water table elevation. This shall be established by three successive readings of water level taken at an interval of two hours.

4.4 LABORATORY TESTS

All laboratory tests to be performed in NABL accredited/Government approved laboratory. The laboratory tests shall essentially comprise of, but not limited to the following:

4.4.1 Grain Size Distribution

Wherever applicable both the sieve and hydrometer analysis shall be conducted to indicate complete range of grain sizes of soil samples tested.

4.4.2 Atterberg's Limits

Wherever applicable, these tests shall be carried out by the skilled personnel. The test result should include liquid limit, plastic limit and shrinkage limit of the soil samples tested. These tests should be conducted as per IS: 2720 Part V & VI.

4.4.3 Consolidation Tests

The tests shall be conducted for vertical drainage only. The following loading stages shall be employed: 0.1, 0.25, 0.50, 1.0, 2.0, 4.0, 8.0 kg/cm². From e Vs $\log p$ curves, pre-consolidation pressure shall be determined to establish whether the soil is normally consolidated or over-consolidated. The point (e , p) showing initial condition of the soil under test must be specifically marked on the consolidation curves. Cycle(s) of loading, unloading and reloading shall be applied. The field virgin compression curve shall be established. Settlement predictions based on the field virgin compression curve shall only be acceptable. The procedure adopted in respect of obtaining compression indices from the field curve and that for computing settlements for the type of soil under consideration shall be clearly illustrated in the report. It is to be noted that deviations from the standard procedure of performing consolidation tests given in IS: 2720 Part XV are permissible in order to enable computation of settlements based on the above procedure.

The following curves shall be included in the report:

1. e Vs $\log p$
2. e Vs p
3. Compression $v/s \log (t)$ or compression vs. square root ' t '

The choice of relationship depends upon the shape of the plot, which enables, clear determination of c_v , the coefficient of consolidation.

The time period required for 50% & 90% primary consolidation shall be given in the report.

p_c (pre-consolidation pressure) shall be clearly indicated in the e - $\log p$ curve.

Values of m_v and c_v shall be furnished for different pressure ranges including the values of e_o , C_c & p_c in tabular form.

Computation of secondary settlements, if significant, shall also be made and included in the report.

4.4.4 Triaxial Tests

These tests shall be done on specimen saturated by the application of backpressure as IS: 2720 (Part 11):1993. Only if the water table is at sufficient depth so that chances of its rising to the base of the footing are meager or nil, the triaxial tests shall be performed on specimens at natural moisture content. The magnitude of the backpressure applied shall be indicated in the report. Unconsolidated undrained/Consolidated undrained tests shall be carried out on the respective soil samples collected.

All the stress-strain diagrams as well as Mohr's circle envelopes shall be included in the report. Density and water content of the sample tested and modulus of elasticity along with shear strength parameters shall be reported.

Relevant corrections applied to the computed ' E ' shall be clearly illustrated in the report.

In case the soils are predominantly sandy in nature and sampling is not possible for triaxial shear tests, box shear tests shall be carried out.
