- e) Primer may be used by spray equipment or hand brushing.
- f) Primed pipe shall be protected from contamination by moisture dust or foreign matter before application of the tape wraps.
- g) Immediately after application of primer (the primer must be allowed to dry completely, refer to manufacturers instruction) the pipeline shall be spiral wrapped with laminated inner tape wrap and outer tape wrap.
- h) The tape shall be applied with tension controlled provide a uniform, tightly adhesive coating free from wrinkles, puckers, void, or break.
- i) The wrapping machine shall be equipped with an overlap control device properly adjusted to provide the following minimum overlap under all conditions.

## 11. Guidelines:

- a) All welding works, equipment for welding, heat treatment, other auxiliary functions and the welding personnel shall meet the requirements of the latest editions of the following codes, standards and specifications as listed below:-
  - Code for Gas Transmission and Distribution Piping System (ANSI B31.8).
  - Standard for welding of Pipelines and Related Facilities (API 1104).
  - Specification for welding Electrodes and Filler Materials (ASME Sec. II C).
  - Non Destructive examination (ASME Sec. V).

Before welding, all rust and foreign matter shall be removed from the bevelled ends by power operated tools. This shall be effected inside and outside and for a minimum distance of 25mm from the edge of the weld bevel. If welding procedure is not followed as mentioned above, OIL reserves the right not to pay the bidder against invoice raised for the said job.

Immediately prior to line-up bidder shall inspect the pipe ends inside and outside for damage, dents, laminations etc. Pipe for welding shall be set up, correctly spaced, allowing for temperature changes during welding, in correct alignment and shall in no circumstances be sprung into position. Temporary attachments of any kind shall not be welded to the pipe. Welds joining the sections of the pipelines, valve installation or similar welds classified as tie-in welds shall be made in the trench. Otherwise the alignment and welding shall be made alongside the ditch with the pipe supported on skids and back pad or other suitable means approved by COMPANY, at least 500mm above the ground, unless approved by the COMPANY in specific cases.

Preheating shall be performed using resistance or induction/ heating methods. Preheating by gas burners, utilising acetylene or propane gas may also be carried out. Oxypropane gas may be used with the permission of the COMPANY under careful supervision. The heat treatment of welded joints shall be carried out as per the requirements laid down in ANSI B31.8.

The non-destructive examination shall mainly consist of examination using x-ray radiography. Radiographic examination of one hundred percent (100%) girth welds will be required by the COMPANY.

- b) All painting jobs in the pipeline needs to be carried out. Initially a layer of red oxide should be applied. After that two layers of aluminum paint should be applied.
- c) Each length of pipe shall be thoroughly examined internally and externally to make sure that it is free from visual defects, damage, corrosion, dirt, animals or any other foreign objects. Each length of the pipe shall be adequately swabbed, either by use of canvas belt disc of proper diameter or by other methods approved by the COMPANY. Damaged/corroded pipes shall be kept separate. Each length of pipe shall be pulled through just before being welded.
- d) The maximum permissible depth of dents in pipes upto and including 123/4" OD is 5mm. Dents which contain a stress concentrator such as scratch, gauge, arc burn or groove, and dents located at the longitudinal, spiral or circumferential weld shall be removed by cutting out the damaged portion of pipe as a cylinder.
- e) Repair on line pipe shall be executed as specified in Code ANSI B 31.8/B 31.4. A record of all repairs is to be maintained by Bidder.
- f) Lowering in Trench: Lowering can start after removal from ditch bottom of all off cuts, pipe supports, stones, roots, debris, stakes, rock projections below underside of pipe and any other rigid materials which could lead to perforation or tearing of the coating. Lowering shall follow as soon as possible, after the completion of the joint coating of the pipeline. Before lowering in, short completed sections of the pipeline shall be cleaned with compressed air in order to remove all dirt, etc. from the inside of pipe sections.
- g) Backfilling shall be carried out immediately after the pipeline has been laid in the trench, inspected and approved by the COMPANY, so as to provide a natural anchorage for the pipeline, thus avoiding long exposure of coating to high temperature, damaging actions of adverse weather conditions, sliding down of trench sides and pipe movement in the trench. If immediate back filling is not possible, a covering of at least 200mm of earth, free of rock and hard lumps shall be placed over and around the pipe and coating.
- h) Where the Ends of the piping components being welded have an internal surface misalignment exceeding 1.6mm, the wall of the component extending internally shall be trimmed by machining so that the adjoining internal surfaces will be approximately flush.
- i) All exposed surfaces like piping, valves, structures, and miscellaneous appurtenances shall be painted. The corrosion coating on pipe surface will end approximately 0.3 meter above the finish grade.
